SUMMARY

Software engineer at Docuscan, a fintech building document fraud detection and compliance products. I was hired onto the frontend in April 2025 and now build features end to end across the frontend, backend, database and AWS. I spend most of my free time on my own projects, including a self-hosted smart display, a Raspberry Pi home server and a VS Code extension, which have taken me into cloud deployment, networking and hardware design.

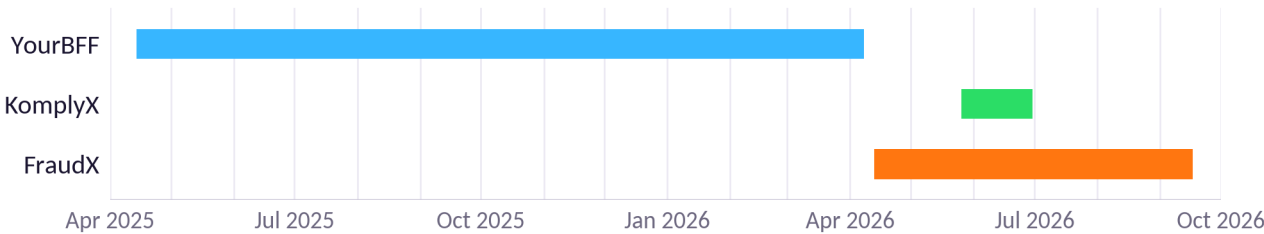

SKILLS

Languages: TypeScript, JavaScript, SQL, HTML, CSS
Frontend: React, Vite, TanStack Query and Router, Zustand, Tailwind CSS, Mantine, three.js
Backend: Node.js, Express, Hono, Supabase (Postgres, Realtime), REST APIs
Infrastructure: AWS (Lambda, S3, SES, CloudFront), Docker, Tailscale, Linux
Tools: Git, Slack API, React Email, Claude Code, OpenSCAD

EXPERIENCE

Docuscan Apr 2025 - Present
Junior Frontend Software Engineer (working full-stack) Melbourne, VIC

- Hired as a frontend developer and moved into full-stack work within months.

 **FraudX** (document fraud detection, \$100/month + GST, 217 users) Apr 2026 - Present

- Wrote around 40% of FraudX's current application code (web app, API and database).
- Working on an issuer registry that remembers what a legitimate document from each issuer should look like. Built the internal tools used to load and review its data.
- Built the verdict override system end to end, from Postgres schema and API endpoints to the UI, audit log and Slack escalation messages.
- Built the Risk Management review workflow with its own permission model, released behind feature flags.
- Built the Claim Map, an interactive graph of the documents, fields and claims behind each verdict.

 **KomplyX** (compliance case management) May 2026 - Jun 2026

- Built an entity relationship map showing the people and companies linked to a case.
- Built realtime notifications with email preferences, and a support ticketing system.

- Main frontend contributor, having written 58% of the current frontend codebase, and a regular contributor to the Node backend.
- Built the broker request edits workflow, including in-document editing and diff views of requested changes.
- Built the audit timeline end to end, from backend event recording to the timeline UI.
- Built a file naming convention engine with a visual template builder, applied on the backend when documents are submitted.

PERSONAL PROJECTS

HiltsMatt.dev | *React, Hono, three.js, AWS Lambda, CloudFront, S3*

- Personal portfolio with a React frontend and Hono API deployed on AWS, with project pages generated from my GitHub repos.

MattBoard | *React, Express, Supabase*

- Open source, self-hosted smart display with a drag and drop layout builder, designed to run on a Raspberry Pi.

Raspberry Pi home server | *Docker, Node.js, Tailscale, Linux, OpenSCAD*

- Runs a self-hosted music server (Navidrome), network file share (Samba) and photo library (Immich) in Docker, accessed remotely over Tailscale.
- Offloads Immich's machine learning to my desktop PC, with a Node service that starts the worker over SSH whenever the PC is on.
- Node service that wakes and shuts down my PC remotely using Wake-on-LAN and SSH, with its status shown on an iOS home screen widget.
- Modelled a 3D printed stacking enclosure for the server in OpenSCAD, a declarative CAD language, with every dimension defined as a variable.

Claude Crab | *TypeScript, VS Code Extension API*

- VS Code extension that animates a pixel art crab based on what Claude Code is doing.

EDUCATION

RMIT University

Until 2025

Studied towards a Bachelor of Information Technology

Caulfield Grammar School, Wheelers Hill

Victorian Certificate of Education (VCE)
